DDS

DDS Import, the solution for
the Import Supply Chain

Tracking, organizing and controlling international flows

It is particularly complex for companies to control a worldwide supply chain, while controlling the cost of every imported product.

DDS Logistics has developed DDS Import, an application dedicated to the control of the import supply chain, to help purchasing organizations, importers and manufacturers that work with international suppliers.

DDS Import is a Track & Trace-oriented solution that provides visibility of orders and flows, and minimizes risks of delays and extra costs of international transport operations.

DDS Import is also a collaborative platform for your staff and your suppliers, shipping companies, forwarding agents and logistics partners.

Securing every link
in the import supply chain

DDS Import is made up of various modules covering all of your operations:

Order Management

A comprehensive order management tool designed to collect and track all the details of the ordered products and to organize the quality inspections. It also features tools to collaborate with suppliers with a view to improving the reliability of the information about orders and the supply of products

Import Supply chain

The Import Supply Chain module offers full control of operations, from the organization of transport (sea, air and road) to the scheduling of appointments with the warehouses. The collaborative portal allows for communication in almost real time with service providers for the management of bookings and shipments.

Track & trace

The Track & Trace application tracks flows of orders and documents from end to end, providing clear visibility of product quantities at every step. Our alert engine technology detects incidents, automatically raises alerts and can launch corrective actions.

Cost Control

This solution covers both pre-invoicing and the control of the cost of logistics and transport services, plus the reconciliation of invoices and goods. It can also issue payments by credit note. Its powerful features can also calculate the import cost price per product.

Performance indicator

The DDS Dashboard decision-support solution is integrated in DDS Import. It clearly and quickly displays the key performance indicators and shares them with employees. Analyses of flows, cost items, supplier quality and revenue by criterion are just some of the KPIs available from DDS Dashboard.

Measurable gains
throughout the import process

- Significant cuts in transport costs made by optimizing the occupancy rate of containers, reducing air travel and controlling invoices more effectively,

- Permanent visibility of the quantities of products ordered and actually in process of supply,

- The ability to control risks of delays or procurement breakdowns,

- More productive and efficient import operations,

- Tighter control of purchases, right up to the control of cost prices by product.
